

Instructions for compiling and running the model in ‘Macroecological scaling patterns as an emergent property of trophic interactions’

Anne Willem Omta

Below, there are brief technical instructions for compiling and running the linear- and hyperbolic-closure models used in ‘Macroecological scaling patterns as an emergent property of trophic interactions’. Please send an e-mail to anne.omta@case.edu, in case you encounter any problems.

The FORTRAN code is in `settle.f`. Under Unix, this code is compiled with
`f95 -o set settle.f`

and the executable `set` is run as a background process with
`./set &`

Output of P and Z as a function of time is written to `fort.70` and `fort.80`, respectively. These should correspond with Fig. 3a of the article.
